

## C Programming Lecture 5

Thursday, 13 June 2024 8:19 PM

### Operators in C

An operator is simply a symbol that is used to perform operations. There can be many types of operations like arithmetic, logical, bitwise, etc.

There are following types of operators to perform different types of operations in C language.

- Arithmetic Operators
- Relational Operators
- Logical Operators
- Bitwise Operators
- Assignment Operators
- Misc Operators

### Arithmetic Operators

**Arithmetic operators** carry out fundamental mathematical operations.

S. No.	Symbol	Operator	Description	Syntax
(B) 1	+	Plus	Adds two numeric values.	<u>a + b</u>
(B) 2	-	Minus	Subtracts right operand from left operand.	<u>a - b</u>
(B) 3	*	Multiply	Multiply two numeric values.	a * b
(B) 4	/	Divide	Divide two numeric values.	a / b
(B) 5	%	Modulus	Returns the remainder after dividing the left operand with the right operand.	a % b
(u) 6	+	Unary Plus	Used to specify the positive values.	<u>+a</u>
(u) 7	-	Unary Minus	Flips the sign of the value.	<u>-a</u>
(u) 8	++	Increment	Increases the value of the operand by 1.	a++
(u) 9	--	Decrement	Decreases the value of the operand by 1.	a--

$a = -3;$   
 $\uparrow$   
 unary

$a = +3;$   
 $\uparrow$   
 unary

## pre and post increment / decrement

pre  $++a$        $--a$   
 post  $a++$        $a--$

post inc/dec :- The value is used first and then the op<sup>n</sup> is performed

pre inc/dec :- First the op<sup>n</sup> is performed then the value is used.

$\boxed{\cancel{3}} \boxed{4}$   
 $a$

①  $\text{int } a = 3; \checkmark$

$\text{a}++;$        $++a;$   
 $\text{printf}(\text{"\%d"}, a);$

①

$\text{int } a = 3; \checkmark$

$\text{int } b = (\text{a}++);$

$\text{printf}(\text{"\%d, \%d"}, a, b);$

$a++ \Leftrightarrow a = a + 1;$

②

$\text{int } a = 3;$

$\text{int } b = (++a);$

$b = (\text{++a})$

$b = (4)$

$\boxed{\cancel{3}} 4$        $\boxed{4}$   
 $a$        $b$

$\boxed{3}^4$   $\boxed{3}$   
a b

eg. `int a=3, b=4;`  
`int c = (a++) + (--b);`  
`printf("a=%d, b=%d, c=%d", a, b, c);`

$\boxed{4}$   $\boxed{3}$   $\boxed{4}$   $\boxed{3}$   
a b  
c  $\boxed{6}$

`c = (a++) + (--b);`

`c = (3) + (--b);`

`c = (3) + (3);`

`c = 6;`

o/p:- `a=4, b=3, c=6`

```
// C program to illustrate the arithmetic operators
```

```
#include<stdio.h>
```

```
int main() {
```

```
    int a = 25, b = 6;
```

```
    // using operators and printing results
```

```
    printf("a + b = %d\n", a + b);
```

```
    printf("a - b = %d\n", a - b);
```

```
    printf("a * b = %d\n", a * b);
```

```
    printf("a / b = %d\n", a / b);
```

```
    printf("a %% b = %d\n", a % b);
```

```
    printf("+a = %d\n", +a);
```

```
    printf("-a = %d\n", -a);
```

```
    printf("a++ = %d\n", a++);
```

```
    printf("a-- = %d\n", a--);
```

```
    return 0;
```

```
}
```

$$a + b = 31$$

$$a - b = 19$$

$$a * b = 150$$

$$a / b = 4$$

$$a \% b = 1$$

$$+a = 25$$

$$-a = -25$$

$$a++ = 25$$

$$a-- = 26$$

$$25 / 6$$

↓   ↓  
int   int

$$\boxed{25} \quad \boxed{6}$$

2B   2B

$$\boxed{4}$$

2B

## Relational Operators

**Relational operators** assess the relationship between values by comparing them. They return either true (1) or false (0).

S. No.	Symbol	Operator	Description	Syntax
1	<	Less than	Returns true if the left operand is less than the right operand. Else false	<u>a &lt; b</u>
2	>	Greater than	Returns true if the left operand is greater than the right operand. Else false	<u>a &gt; b</u>
3	<=	Less than or equal to	Returns true if the left operand is less than or equal to the right operand. Else false	<u>a &lt;= b</u>
4	>=	Greater than or equal to	Returns true if the left operand is greater than or equal to right operand. Else false	<u>a &gt;= b</u>
5	==	Equal to	Returns true if both the operands are equal.	<u>a == b</u>
6	!=	Not equal to	Returns true if both the operands are NOT equal.	<u>a != b</u>

// C program to illustrate the relational operators

```
#include<stdio.h>
```

```
int main() {
```

```
    int a = 25, b = 6;
```

```
    // using operators and printing results
```

```
    printf("a < b : %d\n", a < b); 0
```

```
    printf("a > b : %d\n", a > b); 1
```

```
    printf("a <= b: %d\n", a <= b); 0
```

```
    printf("a >= b: %d\n", a >= b); 1
```

```
    printf("a == b: %d\n", a == b); 0
```

```
    printf("a != b : %d\n", a != b); 1
```

```
    return 0;
```

```
}
```

a < b : false

## Logical Operators

**Logical operators** perform logical operations on **boolean values** and return either true (1) or false (0).

S. No.	Symbol	Operator	Description	Syntax
1	&&	Logical AND	Returns <u>true</u> if <u>both the operands</u> are true.	<code>a &amp;&amp; b</code>
2		Logical OR	Returns <u>true</u> if <u>both or any of the operand</u> is true.	<code>a    b</code>
3	!	Logical NOT	Returns <u>true</u> if the operand is false.	<code>!a</code>

// C program to illustrate the logical operators

```
#include<stdio.h>
```

```
int main() {  
    int a = -1, b = 0;
```

```
    // using operators and printing results
```

```
    printf("a && b : %d\n", a && b);
```

```
    printf("a || b : %d\n", a || b);
```

```
    printf("!a: %d\n", !a);
```

```
    return 0;
```

```
}
```

-1      0  
a            b

a: True  
b: False

$a \&\& b = 0$

$a || b = 1$

$!a = 0$

operands  
↳ boolean  
true    false  
         0  
anything  
other than  
0

a	b	$a \&\& b$
T	T	T
T	F	F
F	T	F
F	F	F

a	b	$a    b$
T	T	T
T	F	T
F	T	T
F	F	F

a	$!a$
T	F
F	T

Example:

```
#include<stdio.h>
int main(){
    int a = 50, b = 51, c = 5;
    printf("%d", (a==(--b)) && (b/c == 10));
    return 0;
}
```

(a==50) && (b/c == 10)  
1 && 1  
true && true  
true → ①

Bitwise Operators

Bitwise operators perform operations on individual bits of the operands. The Bitwise operators are used to perform bit-level operations on the operands. The operators are first converted to bit-level and then the calculation is performed on the operands. Mathematical operations such as addition, subtraction, multiplication, etc. can be performed at the bit level for faster processing.

S. No.	Symbol	Operator	Description	Syntax
(B) 1	&	Bitwise AND	Performs bit-by-bit AND operation and returns the result.	a & b
(B) 2		Bitwise OR	Performs bit-by-bit OR operation and returns the result.	a   b
(B) 3	^	Bitwise XOR	Performs bit-by-bit XOR operation and returns the result.	a ^ b
(u) 4	~	Bitwise First Complement	Flips all the set and unset bits on the number.	~a
(B) 5	<<	Bitwise Left shift	Shifts the number in binary form by one place in the operation and returns the result.	a << b
(B) 6	>>	Bitwise Right shift	Shifts the number in binary form by one place in the operation and returns the result.	a >> b

int a = 10, b = 7;

$a \& b = 2$      $a | b = 15$

2	10	
2	5	0
2	2	1
	1	0

2	7	
2	3	1
	1	1

$$\begin{array}{r} a \ 1010 \\ b \ 0111 \\ \hline 0010 \\ 2^3 2^2 2^1 2^0 \end{array}$$

$$\begin{array}{r} a \ 1010 \\ b \ 0111 \\ \hline 1111 \\ (15) \end{array}$$

$a \wedge b = 13$

(2)

a	b	a & b
1	1	1
1	0	0
0	1	0
0	0	0

a	b	a   b
1	1	1
1	0	1
0	1	1
0	0	0

a	~a
0	1
1	0

a	b	a ^ b
1	1	0
1	0	1
0	1	1
0	0	0

$$\begin{array}{r} a \ 1010 \\ b \ 0111 \\ \hline a \wedge b \ 1101 \end{array} \quad (13)$$

8 + 4 + 1

$13 \gg 1 = 6$   
Dividing by 2

$13 \ll 1 = 26$   
Multiplying by 2

Right shift,  
leftmost bit gets copied  
in the leftmost place

left shift  
rightmost bit always 0

$a = a * 2$ ; costly.  
 $a = a \ll 1$ ; ✓ cheaper

### Example:

```
// C program to illustrate the bitwise operators
#include<stdio.h>
int main() {
    int a = 25, b = 5;

    // using operators and printing results
    printf("a & b: %d\n", a & b);
    printf("a | b: %d\n", a | b);
    printf("a ^ b: %d\n", a ^ b);
    printf("~a: %d\n", ~a);
    printf("a >> b: %d\n", a >> b);
    printf("a << b: %d\n", a << b);
    return 0;
}
```

$$25 \gg 5 = 0$$

$$25 \ll 5 = 800$$

$$25 \times 2 \times 2 \times 2 \times 2 \times 2 \\ = 25 \times 32 = 800$$

Handwritten binary representation and bitwise operations:

a: 25 (11001)  
b: 5 (101)

Bitwise operations (results in parentheses):

- a & b: 00000001 (1)
- a | b: 00011101 (29)
- a ^ b: 00011100 (28)

Handwritten calculation for a >> b:

a >> b

0000 0011 (25) shifted right by 5 bits (indicated by arrows) results in 0000 (0).

## Assignment Operator

$a = 3$

Assignment operators are used to assign values to variables. The left side operand of the assignment operator is a variable and the right side operand of the assignment operator is a value.

The assignment operators can be combined with some other operators in C to provide multiple operations using single operator. These operators are called compound operators.

S. No.	Symbol	Operator	Description	Syntax
1	=	Simple Assignment	Assign the value of the right operand to the left operand.	$a = b$
2	+=	Plus and assign	Add the right operand and left operand and assign this value to the left operand.	$a += b$
3	-=	Minus and assign	Subtract the right operand and left operand and assign this value to the left operand.	$a -= b$
4	*=	Multiply and assign	Multiply the right operand and left operand and assign this value to the left operand.	$a *= b$
5	/=	Divide and assign	Divide the left operand with the right operand and assign this value to the left operand.	$a /= b$
6	%=	Modulus and assign	Assign the remainder in the division of left operand with the right operand to the left operand.	$a \% = b$
7	&=	AND and assign	Performs bitwise AND and assigns this value to the left operand.	$a \& = b$
8	=	OR and assign	Performs bitwise OR and assigns this value to the left operand.	$a  = b$
9	^=	XOR and assign	Performs bitwise XOR and assigns this value to the left operand.	$a \wedge = b$
10	>>=	Rightshift and assign	Performs bitwise Rightshift and assign this value to the left operand.	$a >> = b$
11	<<=	Leftshift and assign	Performs bitwise Leftshift and assign this value to the left operand.	$a << = b$

$a = a + b$

$a = a - b$

$a = a * b$

$a = a / b$

$a = a \% b$

$a = a \& b$

$a = a | b$

$a = a \wedge b$

$a = a >> b$

$a = a << b$

```
// C program to illustrate the assignment operators
#include<stdio.h>
```

```
int main(){
    // using operators and printing results
    int a, b;
    a = 5; ✓
    b = a; ✓
    a += 3; → a = a + 3;
    b -= 3; → b = b - 3;
    a *= b; → a = a * b;
    a /= 4; → a = a / 4;
    a %= 3; → a = a % 3;
    a &= 11; → a = a & 11
    a ^= b; → a = a ^ b
    a >>= 1; → a = a >> 1
    b <<= 2; → b = b << 2
    printf("a = %d, b = %d", a, b);
    return 0;
}
```

a = 1, b = 8

## Miscellaneous Operators

Apart from the above operators, there are some other operators available in C used to perform some specific tasks.

### sizeof Operator

- sizeof is much used in the C programming language. ✓
- It is a compile-time unary operator which can be used to compute the size of its operand.
- The result of sizeof is of the unsigned integral type which is usually denoted by size\_t.
- Basically, the sizeof the operator is used to compute the size of the variable or datatype.

sizeof(char);

↳ unsigned long

sizeof (operand) ✓

```
// C Program To demonstrate sizeof operator
```

```
#include<stdio.h>
```

```
int main() {
```

```
    printf("sizeof char = %lu\n", sizeof(char));
```

```
    printf("sizeof int = %lu\n", sizeof(int));
```

```
    printf("sizeof float = %lu\n", sizeof(float));
```

```
    printf("sizeof double = %lu\n", sizeof(double));
```

```
    int a = 0;
```

```
    double d = 10.21;
```

```
    printf("sizeof int + double = %lu", sizeof(a + d));
```

```
    return 0;
```

```
}
```

Handwritten notes for the sizeof program:

- 1 → 32B 64B
- 2/4
- 4
- 8
- 8 (circled)

Handwritten diagrams for memory sizes:

- a (2B) + d (double, 8B)
- double (8B)

## Comma Operator (,)

- The comma operator (represented by the token ,) is a binary operator that evaluates its first operand and discards the result, it then evaluates the second operand and returns this value (and type).
- The comma operator has the lowest precedence of any C operator.
- Comma acts as both operator and separator.

operand1 , operand2

Handwritten example: a=3, b=4, c=5;

```
// C Program to Demonstrate comma operator
#include<stdio.h>
int main() {
    // comma as a separator
    int x = 10, y = 15;

    // using comma as an operator
    printf("%d \n", (x, y)); 15

    y = (x++, ++x); ←
    // using comma as an operator
    printf("%d \n", (x, y)); 12

    // using comma as terminator ✓
    printf("Hello \n"),
    printf("World!");

    return 0;
}
```

$a = (3, 4);$   
 $a = (b=3, c=5);$

$\text{int } x = 10, y = 15;$

### Conditional Operator (?:)

- The conditional operator is the only ternary operator in C++.
- Here, Expression1 is the condition to be evaluated. If the condition(Expression1) is True then we will execute and return the result of Expression2 otherwise if the condition(Expression1) is false then we will execute and return the result of Expression3.
- We may replace the use of if..else statements with conditional operators.

```
// C Program to Demonstrate ternary operator
#include<stdio.h>
int main() {
    int a = 5;
    int b = 3;

    printf("%d", (a > b) ? a : b); 5
    return 0;
}
```
